

PREPARE FOR WINTER WITH

Properly preparing your swimming pool for Winter is important in avoiding freeze damage and preventing swamp green water in the Spring. Issues that can be expensive and difficult to resolve and repair. APi E-Z POOL® is the ideal product for winterization, safe for all types of pools and easy to use.

E-Z POOL®

In one E-Z application, E-Z POOL® simplifies pool closings and winterizing for chlorine, bromine and salt water pools. No pre-treating or other chemicals needed. E-Z POOL® provides a long-life non-chlorine shock that isn't temperature or light sensitive, won't fade pool surfaces or degrade your cover. E-Z POOL® also contains a strong long-lasting algaecide, buffers to help keep water balanced, stain prevention and scale prevention. Protection for your pool water all Winter long.

ENZyme PRO®

In addition to E-Z POOL® use ENZymePRO® to break down additional organics as they are introduced during the winter months. This concentrated, high strength formula increases chlorine effectiveness and prevents scum and build-up on tile and waterlines.

API products with the exception of Revive!®, RevivePRO® and ENZymePRO® are not for sale in California or Alaska.

PREPARE FOR WINTER WITH

The following steps will help provide clean, clear water, and an easier opening in the Spring:

- Do not winterize a pool until the water is clean, clear, properly balanced and has no signs of visible algae growth.
- Brush and vacuum the pool carefully, making sure all leaves, dirt or other debris are removed.
- If the pool is closed too early in the Fall or opened too late in the Spring additional algae growth is possible. Avoid stagnant water in warmer temperatures, especially if you have a mesh safety cover. Close the pool late in the Fall and open early in the Spring to beat the heat!
- Important! Continue to clean and fully treat your pool each week up until closing.
- Check the water level for one week prior to closing. Failure to detect leaks may cause ice movement and possible damage.
- Inspect the winter cover and winterization equipment for damage or excessive wear and replace as needed.
- Test water and make necessary adjustments within the week you plan to close.

Balanced Water protects equipment and pool finishes.

Unbalanced Water is corrosive, prone to staining, forming scale and can increase equipment and chemical costs.

IDEAL LEVELS:

- Chlorine: 1-4ppm
- Stabilizer/Cyanuric Acid (CYA): 30-50ppm
- pH: 7.2-7.6
- Total Alkalinity: 80-120 *Finish Dependent
- Calcium Hardness - 200-400ppm

- Apply 2 lbs. of E-Z POOL® per 10,000 gallons of water by adding directly into pool. Circulate continuously for 30 minutes prior to shutting the pump off and pool closing.
- Pour 1 quart of ENZymePRO® per 25,000 gallons of pool water directly in front of a jet. For best results, circulate for 30 minutes prior to pool closing.
- Follow your pool professional's or manufacturer's instructions for properly winterizing your pool structure, plumbing lines and all equipment.
- Remove and clean all ladders/handrails and baskets.
- Clean filters according to manufacturer's recommendations.
- Lower water level, if applicable, according to pool professional's instructions.
- Cover the pool with a well-designed cover according to manufacturer's directions. Repair or replace torn or worn covers as needed to ensure a successful Spring opening. Follow your pool professional's directions for how and when to clean the cover of water and/or debris.
